

Convertible Fund

Managing Equity Risk Over Market Cycles with Convertibles

- » The Calamos Convertible Fund seeks equity-like performance over full market cycles while seeking to reduce equity-market risk.
- » This chart shows how the Convertible Fund performed compared to the U.S. equity market through a few distinct market periods over the past two decades.
- » **The result:** The Convertible Fund has performed in line with the benchmark with a beta of 0.60 and alpha of 2.47% over 20 years (9.40% A shares at NAV vs. 9.39% for the S&P 500 Index).

What Are Convertible Securities?
 Convertible securities combine characteristics of stocks and fixed income securities. Like stocks, convertibles typically offer potential upside participation in rising equity markets. Like bonds, convertible securities may provide income and potential downside protection in declining markets.

Past Performance is no guarantee of future results. Current performance may be lower or higher than the performance quoted. The principal value and return of an investment will fluctuate so that your shares, when redeemed, may be worth more or less than their original cost. Performance reflected at NAV does not include the Fund's maximum front-end sales load of 4.75%; had it been included, the Fund's return would have been lower. For the most recent month fund performance information visit www.calamos.com.

Results are before taxes on fund distributions and assume reinvestment of dividends and capital gains. Logarithmic scales can be useful when looking at performance data over a long period of time. Common percent changes are represented by an equal spacing between the numbers in the scale. For example, the distance between \$1 and \$2 is equal to the distance between \$2 and \$4 because both scenarios represent a 100% increase in price. For standard performance information please see the next page.

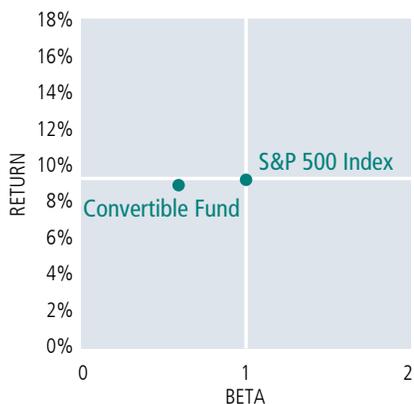

There is no assurance that the fund will achieve or maintain its investment objective.

Upside capture ratio measures a manager's performance in up markets relative to the named index itself. It is calculated by taking the security's upside capture return and dividing it by the benchmark's upside capture return. Downside capture ratio measures manager's performance in down markets as defined by the named index. A down-market is defined as those periods (months or quarters) in which named index return is less than 0. In essence, it tells you what percentage of the down-market was captured by the manager. For example, if the ratio is 110%, the manager has captured 110% of the down-market and therefore underperformed the market on the downside. Source: Morningstar

Calamos Convertible Fund: A Risk-Managed Approach to the Equity Market

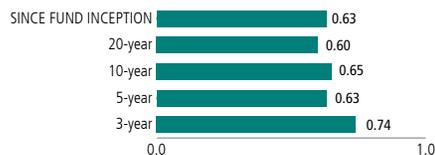

The Convertible Fund provides investors with a core allocation that historically has exhibited lower volatility than the equity market. The fund primarily invests in convertible securities of U.S. companies, but may also invest in equities with the aim of maintaining a balance of risk and reward through full market cycles. Calamos is a pioneer in the convertible asset class and has been investing in convertible securities for more than 30 years.

Important Risk Information. An investment in the Fund(s) is subject to risks, and you could lose money on your investment in the Fund(s). There can be no assurance that the Fund(s) will achieve its investment objective. Your investment in the Fund(s) is not a deposit in a bank and is not insured or guaranteed by the Federal Deposit Insurance Corporation (FDIC) or any other government agency. The risks associated with an investment in the Fund(s) can increase during times of significant market volatility. The Fund(s) also has specific principal risks, which are described below. More detailed information regarding these risks can be found in the Fund's prospectus.

The principal risks of investing in the Fund include: convertible securities risk, consisting of the potential for a decline in value during periods of rising interest rates and the risk of the borrower to miss payments, synthetic convertible instruments risk consisting of fluctuations inconsistent with a convertible security and the risk of components expiring worthless, foreign securities risk, equity securities risk, interest rate risk, credit risk, high yield risk, portfolio selection risk and liquidity risk.

Beta is a historic measure of a fund's relative volatility, which is one of the measures of risk; a beta of 0.5 reflects 1/2 the market's volatility as represented by the Fund's primary benchmark, while a beta of 2.0 reflects twice the volatility. S&P 500 Index is generally considered representative of the U.S. stock market.

Unmanaged index returns assume reinvestment of any and all distributions and, unlike fund returns, do not reflect fees, expenses or sales charges. Investors cannot invest directly in an index.

Before investing carefully consider the fund's investment objectives, risks, charges and expenses. Please see the prospectus and summary prospectus containing this and other information or call 1-800-582-6959. Read it carefully before investing.
